1. Product introduction

Introduction

The Grundfos UP(S) Series 200 line of wet rotor circulators is unique to commercial building services. Most competitor pumps are dry runners. UP(S) wet rotor circulators, on the other hand, are designed so that the water being pumped surrounds the rotor, cooling and lubricating the shaft and bearings.

GrA3223, GrA3217

Fig. 1 Grundfos UP, UPS Series 200 circulator pumps

Wet rotor design eliminates the need for a fan to cool the motor. Fans are often a source of noise and vibrations that can resonate throughout a building via the pipework. Eliminating the fan results in very quiet operation.

UP(S) Series 200 pumps are available in cast iron construction for closed (heating and air conditioning) and bronze construction for open (domestic hot water) systems.

Both cast iron and bronze UP(S) Series 200 pumps utilize laser-welded stainless steel impellers to achieve high pump efficiency.

The standard UP(S) motors are suitable for variable speed drive applications.

Terminal box modules

UPS pumps are equipped with a standard or protection module in the terminal box. Pumps with standard module must be connected to the power supply via an external contactor, whereas pumps with protection module can be connected directly to the power supply.

For further information about the different modules, see pages 17 through 18.

Applications

The pumps are designed for circulation of liquids in heating and air-conditioning systems. They can also be used in domestic hot-water systems.

Applications for the UP(S) pumps include:

- Heating systems for apartments, colleges, hospitals, institutions and schools
- hot water recirculation for hotels, colleges institutions, hospitals, and apartments
- large residential heating
- snow melt.

To ensure optimum operation, the dimensioning range of the system must fall within the performance range of the pump. See sections 6. *Operating conditions* on page 13 and 8. *Technical data* on page 19.

Pumped liquids

Grundfos UP, UPS Series 200 pumps are suitable for pumping thin, clean, non-aggressive and non-explosive liquids, not containing any solid particles, fibers or mineral oil.

In domestic hot-water systems it is advisable to use bronze pumps only for water with a degree of hardness lower than approx. 14°dH. For water with a higher degree of hardness, a Grundfos TP dry-rotor pump is recommended.

The pumps must **not** be used for the transfer of flammable liquids such as diesel oil and gasoline.

For liquid temperature, see section 6. *Operating conditions* on page 13.

Features and benefits

The Grundfos range of UP(S) Series 200 circulator pumps offer many beneficial features:

- Quiet
- maintenance-free
- UPS pumps have a 2 or 3 speed switch, which increases the comfort level for the application
- small profile (one piece vs. three piece)
- sealless, which eliminates worries about hot water leakage
- pumped water lubricates the shaft and bearings so there is no oil to leak
- no couplers to change.

Identification

Type key

Example	UPS	50	-40	(/2)	F	(B)
Type range						
- UP: Single-speed pump						
- UPS: Two- or three-speed pump						
Nominal flange diameter [mm]						
Max. head [dm]*						
Number of motor poles (stated if available both as 2- and 4-pole motor)						
Pump with flanges						
Pump with bronze housing						

*With the exception of the following pump types, where the number is to be considered as a reference number:
UP 53-45, UP 53-46, UPS 53-55/57 and UPS 75-69

5. Construction

Construction

UP(S) Series 200 pumps are of the canned rotor type, i.e. pump and motor form an integral unit without shaft seal and with only two gaskets for sealing.

The bearings are lubricated by the pumped liquid.

Attention has been focused on using as few materials as possible, and the use of materials that might cause problems in connection with disposal have been omitted.

Features:

- UPS motors are two- or three-speed motors. UP motors are single-speed dual-voltage motors.
- Stainless steel rotor can, bearing plate and rotor cladding.
- Stator housing in aluminum alloy.
- Cast iron or bronze pump housing.
- Stator with built-in thermal overload switch.

		Cast iron EN-GJL-250	
16	Pump housing	Bronze CuSn10, DIN 1705	ASTM B505 and B271
17	Anti-friction ring	PTFE	
18	Splash protector	Stainless steel	AISI 303

Sectional drawing

Fig. 3 Sectional view

TM02 1397 0907

Motor

The motor, pos. 4, is a 2- or 4-pole, asynchronous squirrel-cage motor. As the motor is cooled by the pumped liquid, the noise level is very low.

Stator housing

Pressure die-cast aluminum stator housing can be turned to change the position of the terminal box.

The stator housing has eight drain holes to enable condensed water to escape. The vent hole under the terminal box allows the water to evaporate from the stator. The drain holes must point downwards.

The permissible terminal box positions are shown in the drawing below. The positions apply to both vertical and horizontal mounting.

Fig. 4 Possible terminal box positions

TM02 1398 1101

Note: The terminal box must only be turned to the above positions.

The drawing below shows the standard box position.

Fig. 5 Standard terminal box position

TM03 2260 4005

The nameplate can be turned in steps of 45°.

The positions of the terminal box and the nameplate are changed as described above.

The stator wires are self-bonding. The wires and the terminal box are connected by a terminal plug.

The stator incorporates a thermal overload switch for protection of the motor if the winding temperature becomes too high.

Rotor can

The rotor can (pos. 7) is made of drawn steel sheet and fitted with an inspection screw directly at the top.

There is an O-ring seal between the inspection screw and the rotor can. For reasons of safety, the hole for the inspection screw will deflect a possible jet of liquid if the inspection screw is removed.

The outer radial bearing is fitted into the top of the rotor can.

Shaft with rotor

The shaft (pos. 8) is made of stainless steel and equipped with two tungsten carbide bearings.

To further improve the internal circulation of the pumped liquid in the rotor can, the shaft of 4-pole motors is fitted with a small rotor impeller.

The rotor is made of soft-annealed iron lamination and provided with copper or brass bars. The short-circuit rings are made of copper.

The rotor is encapsulated in a thin stainless steel cladding and dynamically balanced.

The thrust bearing is secured to the shaft in a spherically flexible suspension.

Bearing plate

The bearing plate (pos. 10) is made of stainless steel.

The inner radial bearing is pressed into the bearing plate, ground and honed. The relatively large bearing plate surface means that motor heat is effectively carried away by the pumped liquid.

Impeller

The stainless steel impeller (pos. 13) is of the radial type with curved blades. It is secured to the shaft by a split cone and nut (left-hand thread).

Pump housing

The pump housing (pos. 16) is available in cast iron or bronze. All pump housings are flanged for the individual markets.

See also section 4. *Cross-reference guide* on page 8 and section 5. *Construction* on page 10 concerning flanges and port-to-port lengths.

The pump housing is of the in-line type. A stainless steel/PTFE neck ring minimizes the recirculation and improves pump efficiency.

The bottom of the housing has threaded holes for fastening to a baseplate.

6. Operating conditions

Pumped liquids

CAUTION: This pump is intended for use with water only.

Grundfos UP(S) pumps can be used to circulate

- Potable hot water
- Water for hydronic heating
- Water/glycol mixtures up to 50/50
- Cooling water.

In domestic hot-water systems it is advisable to use a bronze pump (UP(S) model) only for water with a degree of hardness lower than 14 grains per gallon of hardness. For water with a higher degree of hardness, a direct coupled TP pump is recommended.

If the pump is installed **in a heating system**, the water should meet the requirements of accepted standards on water quality in heating systems.

In water/glycol mixtures, in order to prevent the glycol from degrading, temperatures above those for which the fluid is rated should be avoided and time spent at high temperatures minimized.

It is also important that the system is cleaned and flushed prior to the installation of the glycol mixture.

In order to avoid problems with corrosion or precipitation, the glycol fluids should be checked and maintained regularly. If further dilution of the supplied glycol is required, follow the requirements of the supplier of the glycol.

The pump is lubricated and cooled by the liquid being pumped. Therefore, the pumped liquid must always be allowed to circulate through the pump. Extended periods without circulation will cause premature wear to the bearings and excessive motor heat. The pumped liquid must also meet the following requirements.

The pumping of liquids with densities or kinematic viscosities higher than those of water will cause

- a considerable pressure drop
- a drop in the hydraulic performance
- a rise in the power consumption.

In these situations, contact Grundfos for assistance.

Temperature limits

Ambient air temperature	32 °F to 104 °F (0 °C to 40 °C)	
Fluid temperature, open systems	140 °F (60 °C).	
Fluid temperature, closed systems	UPS pumps:	248 °F (120 °C).
	UP pumps:	230 °F (110 °C).

Other technical data

Relative humidity: Max. 95 %.

Sound-pressure level: The sound-pressure level of the pump is lower than 41 dB(A) (reference: 20 mPa).

Max. working pressure: 145 psi (10 bar).

Approvals: See the pump nameplate.

Inlet pressure

To avoid cavitation noise, the following minimum pressures are required at the pump suction flange:

UP(S) model	Liquid temperature					
	167 °F (75 °C)		194 °F (90 °C)		230 °F (110 °C)

Electrical data

Supply voltage and frequency

UPS: 115 V, 230 V, 1-phase 60 Hz, 208-230 V, 460 V, 575 V, 3 phase 60 Hz.

UP: 115 V, 230V, 1-phase 60 Hz, 460 V, 575 V, 3-phase 60Hz.

Back-up fuse: Max. 10 A.

Enclosure class: IP 44 indoor use only.

Supply voltage tolerances

The motors meet the requirements to temperature rise at - 6 / +6 %.

Furthermore, the motors have been tested at -10 / +10 % of the voltage range. During these tests, the motors operate without problems and without being thermally cut out.

The motor voltage tolerances are intended for power supply voltage variations. They should not be used for running motors at other voltages than those stated on the name plates.

Variable speed applications

All 3 x 460 V, 3 x 575 V and 3-speed 3 x 208-230 V pumps with standard module are suitable for frequency converter applications. Please refer to section *Variable frequency drive operation* on page 17 for further information.

Terminal box

TM00 9133 4596

Fig. 6 Terminal box

The terminal box with cover (pos. 1) is made from black composite material.

The terminal box is equipped with:

- 1 x 1½" NPT screwed cable entry for mains connection, to be fitted during installation.
- 1 x M16 screwed cable entry for capacitor connection (only single-phase pumps)
- 2 x indicator lights (single-phase pumps with standard module have just one).

Note: UPS pumps only.

- window for indication of speed.

Note: UPS pumps only.

The terminal box is fastened to the stator housing with screws and connected to the stator by a terminal plug.

Insulation class

Pump type	Insulation class

★ Canada only

■ Standard

△ The speed is changed by reconfiguring the jumper positions, located in the terminal box.

● Optional

□ Required

◆ External contactor is not required when using the Protection Module option.

Standard module: Indicator lights with no motor protection. For motor protection, use Protection Module for 1 x 115/230 V and 3 x 208/230 V units or use an external contactor.**Protection module:** Indicator lights with built-in motor protection. Connect directly to line voltage.**Note:** Pumps with protection module must not be connected to a variable frequency drive (VFD).**Relay module:** Indicator lights with signal output for external control or fault indication (1 x 115/230 V or 3 x 208/230 V units only).**External contactor required:** Pump must be connected to line voltage via an external contactor. The contactor is to be connected to the pump's build-in thermal overload terminals. The speed is changed by orientation of the internal jumpers.

Description of functions

Three-speed pumps

Fig. 7 3 x 208/230V terminal box

By means of the speed switch, the pump performance can be adjusted to suit the system in question.

For 1 x 115/230 V and 3 x 208/230 V three-speed pumps only. The module is located inside the terminal box. It has three positions:

Fig. 8 Speed switch module

Switch position	Speed in % of maximum speed	
	Single-phase pumps	Three-phase pumps
1	approx. 60%	approx. 70%
2	approx. 80%	approx. 85%
3	100%	100%

Note: UP pumps runs at 100%.

Change to a lower speed enables considerable reduction in energy consumption and less noise in the system.

Fig. 9 Pump performance at the three speeds

Fig. 10 UPS Series 200 pump with terminal box mounted

Two-speed pumps

All UPS pumps with 3 x 460 V & 575 V terminal boxes are fitted with a special two-speed terminal block.

Fig. 11 3 x 460 V & 575 V terminal box

The speed is changed by changing the jumper positions.

The pump must be connected to the mains via an external contactor. The contactor is to be connected to the pump's built-in thermal overload switch (terminals P1 and P2) to protect the pump against overheating at both speeds.

Speed selection (two-speed, 3 x 460 V and 575 V)

The speed setting in the terminal box can be changed to two positions. The speed in the two positions appears in the table below

Speed step	Speed in % of maximum
1	Approx. 75%
2	100%

Single-speed pumps

UP pumps (1 x 115/230 V)

UP pumps are single-speed pumps with a 1 x 115 V/230 V terminal box with a dual-voltage terminal block. See fig. 12.

TM02 5761 3902

Fig. 12 1 x 115/230 V terminal box

The voltage is changed by changing the orientation of the jumpers. See fig. 12.

The pump must be connected to the power supply via an external switch.

The UP pumps are equipped with a built-in, automatically resetting terminal overload switch, protecting the pump at both 115 V and 230 V. The built-in terminal overload switch (terminals P1 and P2) can optionally be connected to external overload protection.

Pumps with standard module

TM00 9237 4597

Fig. 13 Terminal box with standard module

The standard module is standard in three-phase pumps with three speeds and forms connection between supply terminals and motor.

The pumps with standard module must be connected to the power supply via an external contactor.

For motor protection the contactor is to be connected to the pump's built-in thermal overload switch to protect the pump against overheating at all three speeds.

Standard module indicator lights

The indicator lights on pumps with standard module show whether the pump is live, or whether the phase sequence of three-phase pumps is wrong.

Single-phase pumps

Single-phase pumps incorporate a green indicator light only:

Indicator light	Description
On	The electricity supply has been switched on.
Off	The electricity supply has been switched off, or the pump has been cut out by the thermal overload switch.

Three-phase pumps

Three-phase pumps have a green and a red indicator light:

Indicator lights		Description
Green	Red	
Off	Off	The electricity supply has been switched off, or the pump has been cut out by the thermal overload switch.
On	Off	The electricity supply has been switched on.
On	On	The electricity supply has been switched on. The direction of rotation is wrong.

Variable frequency drive operation

All 3 x 460 V, 3 x 575 V and 3-speed 3 x 208-230 V pumps with standard module are suitable for variable frequency drive (VFD) applications. Please note the following:

- Even if the red indicator light is on, the pump is operating normally.
- Pumps fitted with other modules than the standard module must not be connected to a VFD.
- Depending on the VFD type, this may cause increased acoustic noise from the motor. Furthermore, it may cause the motor to be exposed to detrimental voltage peaks.
- The motor must be protected against voltage peaks higher than 650 V between the motor terminals.

Acoustic noise and detrimental voltage peaks can be reduced by fitting an LC filter between the VFD and the motor.

Pumps with protection module

The protection module is standard for single-phase UPS pumps and available for 3 x 208-230 V UPS pump models only as an option.

When fitted with a protection module, the pump can be connected directly to the power supply switch as it will be protected by the built-in overload protection.

The protection module incorporates two indicator lights.

Protection module indicator lights

Indicator lights		Description
Green	Red	
Off	Off	The pump has been stopped. The electricity supply has been switched off.
On	Off	The pump is operating.
On	On	Three-phase pumps only: The pump is operating, but the direction of rotation is wrong.
Off	On	The pump has been cut out by the thermal overload switch.

Note: Pumps with protection module must not be connected to a variable frequency drive.

Pumps with relay module

The relay module is available for UPS pumps as an option for 1 x 115/230 V and 3 x 208-230 V units.

The module enables direct connection of the pump to an external power supply switch. Furthermore, the module has a signal output for external operating or fault indication. By means of a selector switch the output can be set to activation during operation or fault.

The pump is connected directly to the power supply as the pump incorporates overload protection at all three speeds.

Note: Pumps with relay module must not be connected to a variable frequency drive (VFD).

If the pump has been cut out by the thermal overload switch, it will restart automatically when it has cooled to normal temperature, provided the external on/off contact is closed.

Note: If the thermal overload switch has cut out the pump three times within a short time, the relay must be reset manually by switching off the electricity supply.

Relay module indicator lights

The relay module indicator lights provides detailed operating and fault indications.

All pumps with relay module incorporate a green and a red indicator light. Functions, see table in Signal output of relay module.

Signal output of relay module

The relay module has a signal output for external operating or fault indication.

By means of the selector switch, the signal output can be set to activation during operation or fault.

Operation: The output functions as operating indication between terminals 2 and 3.

Fault: The output functions as fault indication between terminals 1 and 3.

Indicator lights		Signal output set to		Description
Green	Red	Operation	Fault	
Off	Off			The pump has been stopped. The electricity supply has been switched off, or a phase is missing.
On	Off			The pump is operating.
On	On			Only three-phase pumps: The pump is operating, but with wrong direction of rotation.
Off	On			The pump has been cut out by the thermal overload switch.
Flash-ing	Off			The pump has been stopped by an external on/off switch.
Flash-ing	On			The pump is or has been cut out by the thermal overload switch, and it has been stopped by an external on/off switch.

Two pumps plumbed in parallel

Operating modes

Both pumps must be fitted with a relay module.

In addition to the signal functions, the signal output of the relay module for two pumps in parallel can be used for controlling the operating mode of pump 1 and 2.

It is possible to choose between three operating modes:

1. **Alternating operation.** The pumps operate alternately as duty and standby pump, respectively. Changeover takes place every 24 hours. If the duty pump is cut out due to a fault, the standby pump will automatically start. During changeover both pumps will be running for a short period to ensure a low-noise changeover.
2. **Standby operation.** The pumps operate continuously as duty and standby pump, respectively. If the duty pump is cut out due to a fault, the standby pump will automatically start at a signal from the output of the duty pump. The sequence can be changed to make the standby pump operate as duty pump.
3. **Single-pump operation.** The pumps run independently without communicating with each other.

Curve conditions

The guidelines listed below, apply to the performance curves in section 9. *Curve charts and technical data*:

1. Because of the danger of overheating, the pumps must not be used at a flow below 0.1 x Q at best efficiency point.
2. The bold parts of the curves show the **recommended** performance range.
3. Test liquid: Airless water.
4. The curves apply to a liquid temperature of 68 °F (20 °C).

All curves show average values and **should not be used as guarantee curves**. If a stated minimum performance is required, individual measurements must be made.

9. Curve charts and technical data

UPS 32-40/4, 1 ph, 115 V, 230 V, 60 Hz

Flow range:	9 - 52 gpm
Head range:	1 - 11 ft
Motor:	4-pole 0.33 Hp
Max. liquid temp (Open):	+140 °F
Max. liquid temp.:	+248 °F
Min. liquid temp.:	+32 °F
Max. system pressure:	145 psi
Net wt:	35.9 lbs (16.3 kg)
Gross wt.:	43.4 lbs (19.7 kg)
Shipping volume:	1.70 ft ³ (0.048 m ³)
Net wt. bronze:	39.2 lbs (17.8 kg)
Gross wt. bronze:	46.7 lbs (21.2 kg)
Shipping volume bronze:	1.70 ft ³ (0.048 m ³)

Note: ETA is calculated as wire-to-water efficiency.

11. Further documentation

WebCAPS

WebCAPS is a **Web-based Computer Aided Product Selection** program available on www.grundfos.com.

WebCAPS contains detailed information on more than 185,000 Grundfos products in more than 20 languages.

In WebCAPS, all information is divided into 6 sections:

- Catalog
- Literature
- Service
- Sizing
- Replacement
- CAD drawings.

Catalog

This section is based on fields of application and pump types, and contains

- technical data
- curves (QH, Eta, P1, P2, etc) which can be adapted to the density and viscosity of the pumped liquid and show the number of pumps in operation
- product photos
- dimensional drawings
- wiring diagrams
- quotation texts, etc.

Sizing

This section is based on different fields of application and installation examples, and gives easy step-by-step instructions in how to

- select the most suitable and efficient pump for your installation
- carry out advanced calculations based on energy consumption, payback periods, load profiles, life cycle costs, etc.
- analyse your selected pump via the built-in life cycle cost tool
- determine the flow velocity in wastewater applications, etc.

Replacement

In this section you find a guide to selecting and comparing replacement data of an installed pump in order to replace the pump with a more efficient Grundfos pump. The section contains replacement data of a wide range of pumps produced by other manufacturers than Grundfos.

Based on an easy step-by-step guide, you can compare Grundfos pumps with the one you have installed on your site. When you have specified the installed pump, the guide will suggest a number of Grundfos pumps which can improve both comfort and efficiency.

CAD drawings

In this section it is possible to download 2-dimensional (2D) and 3-dimensional (3D) CAD drawings of most Grundfos pumps.

These formats are available in WebCAPS:

2-dimensional drawings:

- .dxf, wireframe drawings
- .dwg, wireframe drawings.

3-dimensional drawings:

- .dwg, wireframe drawings (without surfaces)
- .stp, solid drawings (with surfaces)
- .eprt, E-drawings.

WinCAPS

Fig. 14 WinCAPS CD-ROM

WinCAPS is a **Windows-based Computer Aided Product Selection** program containing detailed information on more than 185,000 Grundfos products in more than 20 languages.

The program contains the same features and functions as WebCAPS, but is an ideal solution if no Internet connection is available.

WinCAPS is available on CD-ROM and updated once a year.
